

**Description:** We plan to test our program using a black box testing method and running checklists over our final project to ensure all user stories work as intended. We will have a central testing document generated and provided as a deliverable to the customer.

**Method:**

1. We have assigned tasks to generate a checklist for each app in our program that will interface with the user. The checklists will cover all actions that a user and a content manager can take on the page.
2. Upon completion of all user stories scheduled to be completed for the release, the developer will notify the tester, and the tester will complete the checklist.
3. When the checklist is complete, the tester will compile the results into a central testing results file, along with any notes regarding the test. The tester will also notify the developer with the results of the test.
4. Upon final product release, the completed central testing results file will be made available to the customer.

**Deliverables:**

- Individual Testing Checklists generated by developers.
- Central Testing Results generated by tester.
