Fantom WCMS Documentation

Pages

Overview:

- Pages provides a way for you to create a static page to display to site visitors.

Usage:

- Currently, pages can be generated by inputting an entry into the database with following JSON format (an editor is planned to be added in the future):

```
{
    "data" : ,       // Fantom serialization of the data to display
    "title" : ,      // Title of page
    "uri" :          // URI of page
}
```

- One can navigate to a page by navigating to base url/app/pages/URI
- By default, the pages app will display a page with a URI of 'index'

Users

Overview:

- Users provides a way for users to manage user permissions throughout the site

Usage:

- Showcases all users in the database and their user details
- Can edit permissions of user groups to control access to individual apps

Themes

Overview:

- Themes allows a content manager to edit the general look and feel of their site.

Usage:

- The current release of Themes allows you to edit the some of the colors on the site. To modify a color, simply select the theme you wish to edit then click on the appropriate button that appears. Currently, the only way to pick a color is to put in a serialized version of it into the text edit box that appears. Here is three sample of input you could use for a Color, Gradient and Pattern (image), respectively:

```
gfx::Color("#00ff00")

gfx::Gradient("linear(0% 0%,100% 100%,#f1c6ff 0.14,#f97766
0.38,#8eb92a 0.49,#72aa00 0.51,#f5ff3a 0.76,#5b38f7 0.9)")

gfx::Pattern {
  image=gfx::Image("/pod/fui/res/img/home-50.png")
  bg=null
  valign=gfx::Valign("repeat")
  halign=gfx::Halign("repeat")
}
```

Settings

Overview:
- Settings is the settings extension for the Fantom WCMS. It allows the user to modify elements in the server and database configuration files.

Usage:
- Click on the respective item you wish to change.
- Under database, there are the following options:
    - Host
        - The address of the database server
    - Port
        - The port number of the database
    - Username
        - The username used to log onto the database
    - Password
        - The password for the respective username
    - Database
        - The name of the database to use
- Under server, there are the following options:
    - Port
        - The port number the web server should be listening for requests on
    - Web Server Title
        - The title of the web server that shows up on tab titles
- After changes are made, click apply to save changes.
